Signs of the Past

This is the 100 pound gorilla of telephone signs. It is an early glass pay station sign from the Bell Telephone Company of Buffalo. It is about 21 by 18 give or take. In my life I have seen only two glass pay station signs and I own both of them. I had a shot at another one at a antique fair 20 years ago and it changed hands 12 times before it left the field. The first buyer paid \$50.00 (oh well). You can see signs like this in the windows of early telephone offices and in early phone booth windows. If you ever see one, buy it, you may never get a second chance.

Are you hungry yet?

The Friday evening steak dinner will be from 5:30 PM until 6:30 PM instead of 5 PM.

The auction, called by Paul Wiltfong, will begin shortly after that. We expect another very good auction with several items from a collector's estate. See you in a few weeks.

Western Electric Transmitter Rim Screws

By Rob Honeycutt

Did you ever wonder when Western Electric changed the transmitter cups to the slotted type using the transmitter attachment screws with a rim below the head? According to some recently acquired material, here is the answer or at least part of the answer.

In January, 1925 AT&T issued Supplement B to their Specifications 3852 Station Apparatus Installation. Now, this spec refers only to the new transmitter rim screw #2545. The information does not mention the new transmitter cup. Actually the proper name for what we call the "cup" is listed in WE catalogs as Back Case or Bell. I suppose the new cup came out along with the screw. This combination made it much easier to replace the transmitter since the repairman did not have to remove the screws completely.

A. T. & T. Co's January, 1925 Specifications 3852 Supplement B

**STATION APPARATUS
INSTALLATION**

TRANSMITTER RIM SCREW # 2545

GENERAL

1. **Reason for Issuing Supplement.** A new method for fastening the transmitter face to the bell has been standardized, which facilitates the removal and replacement of the transmitter face.
2. **Extent of Use.** The application of the new method will necessarily be gradual and therefore it is probable that for some time at least not all transmitters received from the Western Electric Company will be provided with the new screws.

TRANSMITTER RIM SCREW # 2545

3. The new method makes use of the # 2545 rim screw as shown below.

ATTACHING # 128 NUMBER PLATES

4. **In districts** where these number plates are used the following practices apply.
5. **In existing #128 Number Plates** the screw hole is not large enough to take the shoulder of the #2545 screw. The #2014 (old type) rim screw shall be used to attach these number plates. Its use will not prevent the removal of the transmitter face as described in Section 3.
6. **New #128 Number Plates** will have screw holes large enough to take the shoulder of the #2545 Screw and this screw shall be used to attach the new number plates to transmitter which have slotted bells and transmitters which do not have slotted bells.

Garys "Go-Withs"

By Gary D. Goff, #1425

I'm not sure whether to classify this special pencil dialer as an attachment or a "go-with," but I believe that it's more of the latter in that it doesn't really have to be attached to the telephone to be useful.

I own and have seen a number of dialers, but none of this particular style. The dialer is about four inches in length and the chain/hook device about nine inches. It's doubtful that there would have been very much within this distance of the telephone dial to which it might attach, so it's likely that the hook was used to secure the dialer to the phone to make it handy to use.

The only marking that identifies the origin or manufacturer is the word "Germany" which appears at one end of the advertising label. The use of "Germany" suggests to me that it was made in Germany, pre-WWII. In addition, the five digit, non-prefix phone number of the water company supports the pre-war dating. I attempted to locate information about the water company but found nothing via the internet. The use of the term "distilled" in the company name is a very old usage as the majority of water companies were selling "spring water" which is not normally distilled, but filtered.

In any event, this little pencil dialer is undoubtedly an early device that helped to ensure that a writing implement would be close to the telephone. The four pictures will give the reader several views of what was printed on the barrel.

The Greyhound Museum will be hosting its THIRD annual Marathon Run on the same weekend we are hosting the telephone show. Hotel rooms are starting to fill up due to both events the same week. If you have not visited the Greyhound Museum, you will find it to be a very interesting tour.

Abilene is also home to the Eisenhower Museum. If you are not tight on your schedule, you can get a lot of enrichment from these two plus the Telephone Museum.

Mystery Pay Phone

150GJ-55

By Bob Bartlett

A few years ago I received calls from people wanting information on a phone similar to this one. Usually the first thing they say is they have a Gray Telephone Pay Station and Western Electric bottom. Then I have the person describe the whole phone. Not always, but sometimes it was marked 150GJ-55B on back plate or upper housing and sometimes both places.

The code or model number 150GJ was a Gray, which probably had been a 150G, that had a trans/receiver also may have been a WE 150G. Gray or say the independent trade would change the trans/receiver to a handset becoming a 150GJ. Later years, when the initial call of five cents increased to ten cents, the phone code or model number changed also. Now the 150GJ is 150GJ-55. Say the original 150GJ was a Gray model not Western Electric or Automatic Electric. After the Gray model was updated for ten cents is it still a Gray phone after -55 was added to 150GJ?

In the case of this phone, I don't believe so or others like it, have been a mystery to me. Don't think you can say it was a Gray or WE, but a phone put together by an individual or company who used whatever parts they had to refurbish the phone. With the pictures, I'll try to describe the phone and you can see they looked to have been professionally put together.

Upper housing is cast iron, 150 Type (believe Gray), WE 10G lock and 63A dial adaptor, dial and dial cord. AE coin chute with AE parts; two terminals added to the housing contact springs; Gray/WE bottom housing; AE pull bucket; AE door/lock; Gray/WE cast iron back plate; wood terminal strip replaced with bake light type; two terminals added to the upper housing contacts; Gray hopper; early Gray coil relay; AE 40 type hook; WE G1 handset.

This phone doesn't need a subset because of the WE 4010B 1968 network on the back plate; just add a ringer box and it is ready to be used as a payphone. Some of these even had a wiring schematic inside of them.

Maybe Telephone Repair and Supply put these phones together. If anyone has more information about them, let me know or put on listserv. Anyway, sometimes they are a good phone for parts or maybe an interesting phone to some. Maybe they would make a nice transmitter and receiver type phone for the general public and be worth more money and could call them 150G-55. The phone does work.

TELECOM 101 VIDEO

In Four Parts:

- A twenty-five minute narrated tour through the Roseville Telephone Museum, one of the finest Telco museums in the country!
- A thirty-five minute tour through the local loop. Starting in the power room of a central office, you see: the ESS switch, mainframe, cable vault, manhole, cross connect box, aerial and buried terminals, and the denmark. We go into a Controlled Environment Vault and see a remote switch and a DSLAM *DSL Access Multiplexer). We visit some wireless sites and the mobile switching office (MSO) including a site camouflaged as a pine tree.
- A nine-minute video from Corning on the manufacture and use of fiber. On a CD.
- A humorous look at an experimental "pole farm." A company at a secret location is growing utility poles that are ready to use as soon as harvested. They grow without leaves, bark or branches! Seven minutes.

Normally - \$79.95 plus \$6.95 S & H
ATCA Members - \$40.00 plus S & H

WANTED

Phones produced in the Western Electric Indianapolis model shop. Several of us have started work on a timeline of design concepts and prototypes. None of us will probably ever own them all, but it would be interesting to see them together summarized on a web site or newsletter article. Please let me know if you have any prototype sets or models for sale, trade or loan (to study and photograph). I am also interested in acquiring or borrowing good quality photos of phones, documentation and the history of the model shop. We have found interesting info in publications like Western Electric News Features and The Bell Labs Record, but don't have access to many issues. Do you happen to have issues of those or similar publications from the 50s and 60s, or photos of prototypes or oddities in your collection that you'd be willing to share? Thanks.
